

Vista Nova

Independence You Can Hear

The Problem

2.2 billion people live with vision impairment worldwide — most with no fast way to know what, or who, is in front of them.

Source: World Health Organization

NO REAL-TIME AWARENESS

A white cane finds obstacles underfoot — it can't read a sign, find a doorway, or say who's nearby.

OUTDATED TECH

Leading assistive glasses still run on Google Glass — hardware Google introduced in 2013 and never sold to consumers.

PRICED OUT

Purpose-built assistive glasses cost \$1,899–\$3,499, far out of reach for most who need them.

Our Solution

Vista Nova turns the phone in your pocket into eyes you can hear.

Tap the screen and Google's Gemini AI instantly describes your surroundings and who is in front of you — just enough detail to be useful, spoken aloud.

Tap to see

One finger tap captures the moment.

Gemini-powered

Google's current AI.

Any headphones

Wired or wireless — no special gear.

How It Works...

1 Tap

Tap your screen to capture what's in front of you.

2 Gemini sees

Google's Gemini AI reads the scene — objects, surroundings, and who's there.

3 Just enough

It speaks a concise, useful description — the essential to function throughout the day.

4 Any headphones

You hear it through any headphones you already own or through phone audio.

Why it's different...

Today's assistive glasses run on Google Glass hardware from 2013 that never reached consumers, cost up to \$3,499, and reviewers say still read text only from afar — often as gibberish. Social-media glasses like Ray-Ban Meta start under \$300 but were never built for blind users. Vista Nova is built for them: powered by Google's current Gemini AI, on the phone in their pocket and the headphones they already own.
